

Guide for authors

Contents

1. Front matter	1
2. Labelling cells and content	2
3. Links and cross-references	3

1. Front matter

Include extra metadata in the front matter section of a notebook. For example, to list the notebook's authors add their details to the **first cell** of the notebook like this.

```
---
authors:
  - name: Tim Sherratt
    orcid: http://orcid.org/0000-0001-7956-4498
    url: https://timsherratt.au
    mastodon: "@wragge@hcommons.social"
    github: "@wragge"
---
```

You can also include author information in the project configuration settings in the `myst.yml` file. If you include an `id` value (such as 'tim') in the configuration you can use this in the notebook frontmatter instead of repeating all the details.

```
---
authors:
  - tim
---
```

Front matter rules:

- has to be in the first cell of the notebook
- cell has to be set to 'Markdown'
- data has to be valid YAML
- YAML data has to be enclosed top and bottom by `---` lines

If your front matter cell is rendering as plain text, check your YAML for errors.

2. Labelling cells and content

By labelling code and Markdown cells they can be used in cross-references or embedded elsewhere in the book.

Note that labels are accessible across the whole book project, not just a notebook, so should be unique for the book. Make them descriptive, eg `reps-words-per-year-chart` rather than `chart-1`.

To label a code cell, add `#| label: my-cell-label` at the top of the cell, eg:

```
#| label: reps-words-per-year-chart
```

To label a Markdown block put `(my-label)=` on the line above it, for example:

```
(labelling-example)=  
This is an example of labelling markdown
```

Labels can also be added to directives.

3. Links and cross-references
